

SQL OF THE DAY

no address, no ship

02 JUN 2026

StrataScratch · #10090

Nivan RS

THE PROBLEM

Find the percentage of orders that can actually be shipped. An order only counts as shippable when the customer's address is known.

a paid order is not a shipped order...

Easy · PostgreSQL

Nivan RS

THE SOLUTION

```
SELECT
  100.0
  * COUNT(CASE WHEN c.address IS NOT NULL
              THEN 1 END)
  / COUNT(*) AS percent_shipable
FROM orders AS o
INNER JOIN customers AS c
  ON o.cust_id = c.id;
```

HOW IT WORKS

JOIN THE TABLES

INNER JOIN orders to customers so every order can be checked against the address record.

FLAG SHIPPABLE

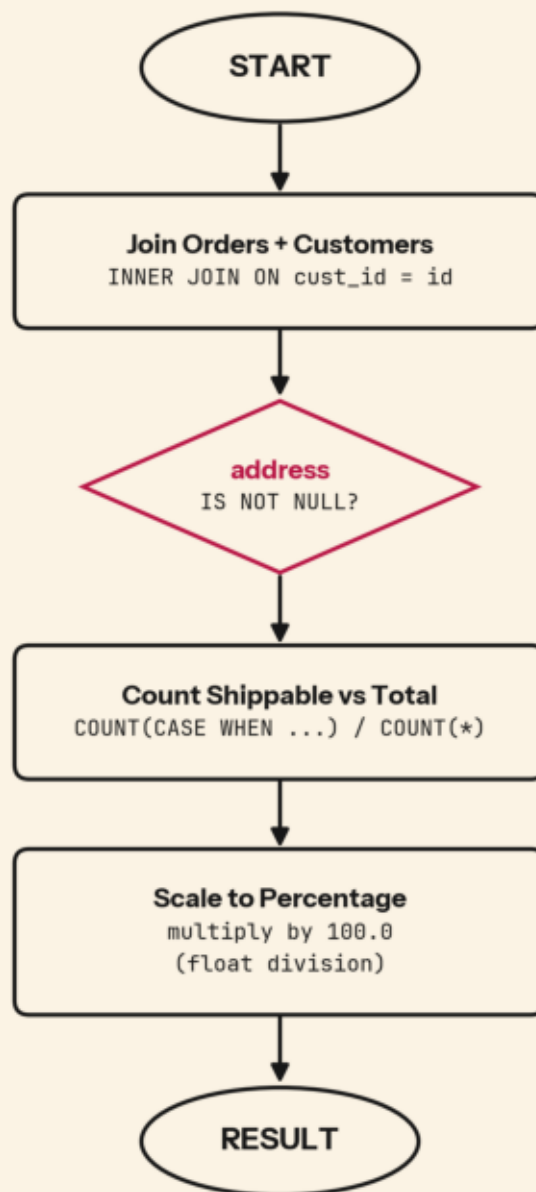

COUNT(CASE WHEN address IS NOT NULL THEN 1 END) counts only orders with a known address.

SCALE TO PERCENT

Divide by COUNT(*) and multiply by 100.0 so the division is floating point, not integer.

THE LOGIC

WHY IT MATTERS

01

Fulfillment readiness

Orders without addresses look valid in the order table, but operations cannot ship them.

02

Cost control

Measuring shippability early avoids wasted picking, packing, routing, and support work.

KEY TAKEAWAYS

- 1 Use `COUNT(CASE WHEN ... THEN 1 END) / COUNT(*)` for explicit percentages where the numerator and denominator are clear.
- 2 The `100.0` (not `100`) forces floating-point division and prevents integer truncation.
- 3 `AVG((condition)::INT) * 100` is a more concise alternative, but less explicit about what is counted.
